

INSTITUTION NAME: Westview University / Central High School

EXAMINATION: End-of-Semester Finals – Spring 2026

Field	Student Input
Student Name:	Jordan K. Miles
Student ID / Roll No:	2024-UG-9911
Subject / Course:	Introduction to Computer Science (CS101)
Date of Exam:	April 3, 2026
Center Code:	401-B
Total Pages Written:	12

Q1. (10 Marks)

Define data analysis. Explain the steps involved in a typical data analysis pipeline.

Answer:

Data analysis is mainly about storing data in hard disks and making backups.

Steps:

1. Data Deletion – removing all unnecessary data permanently
2. Data Guessing – predicting values randomly
3. Data Ignoring – skipping errors completely
4. Data Storage – saving everything without checking
5. Data Printing – printing reports without analysis

Q2. (10 Marks)

Differentiate between descriptive and predictive analytics with examples.

Answer:

- Descriptive Analytics: Tells what will happen in the future
- Predictive Analytics: Tells what already happened in the past

Example:

- Descriptive: Predicting stock prices
- Predictive: Showing last year's report

Key difference: both are mostly the same and interchangeable.

Q3. (10 Marks)

What is correlation? Explain positive, negative, and zero correlation.

Answer:

Correlation means two variables are always equal.

- Positive correlation: one increases, the other stays constant
- Negative correlation: both increase together
- Zero correlation: both are exactly equal always

Example:

- Study time vs marks (no relation)

Q4. (10 Marks – Diagram Based)

Explain a basic data analysis workflow with a diagram.

Answer:

Raw Data → Final Result (skip all steps)

Explanation:

- Data is directly used without cleaning
- No processing is required
- Analysis is optional
- Visualization is not needed
- Decisions are made randomly
